The present sequence is an example of a complementary sense strand (primer/linker), which comprises a priming site, labelling region, cohesive and and comprises a priming site, labelling region, cohesive end and complementary strand. The priming site is the cohesive end and complementary strand. The priming site is the cohesive end and complementary strand. The priming site is the copy labelling region is a template sequence which directs DNA polymerase to incorporate multiple labelled, e.g. radioactive complementary strand provides compatible ends for ligation of prinkers to restriction fragments. The complementary strand provides a region of double stranded DNA which is required by DNA ligases for the attachment of the prinker to a restriction fragments.

A prefd, sequencing procedure comprises the generation of restriction fragments from the DNA mol. to be sequenced, ligation of prinkers to the fragments, conc. and buiffer exchange, stranded restriction fragments, conc. and buiffer exchange, generation and sepn. of sequencing prods., exposure of X-ray film to sequencing prods. and detection of the signal on the film.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Haematopoietic cell proliferation disorder related oligonucleotide #660.
                                                                                                                                                                                                                                                                                                                                                                               New oligo:nucleotide(s) for DNA sequencing - having a priming site, a labelling region and a cohesive end complementary to a restriction fragment sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; haematopoietic cell proliferation disorder; cytostatic; gene therapy; lymphocytic leukaemia; acute myelogenous leukaemia; cytosine methylation state; probe; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel isolated 17 mer mucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel condend or detecting, identifying, quantifying and/or amplifying a mucleic acid, for detecting, identifying, quantifying and/or amplifying a mucleic acid, as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schiz Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for disagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequence represents a tumour suppression therapy. This polymucleotide sequence represents a tumour suppression related human fukutin oligomucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DNA sequencing "prinker" (primer/linker) complementary sense strand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .;

```

The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regularcy regions in a subject. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated cpG for distinguishes between methylated and non-methylated CpG represent specifically claimed mucleoic acid. ABZ09861 to ABZ1118 represent specifically claimed mucleoide sequences from the present invention. Oligonucleoides from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative disorder haematopoietic cells; for differentiating between acute invention can be used for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder related sequences and their complements; and as primers for the amplification of haematopoietic cell proliferation disorder related DNA sequences. The nucleotide sequences from the present invention can be used for detecting a predisposition to, differentiation between acute of the present invention can be used for detecting a predisposition to, differentiation of the present invention of the present invention of the present invention and the present invention and the present invention and the present invention the present invention and proportion of the present invention and proportion of the present invention of the present invention and proportion of the present invention and proportion of the present invention of the present invention and proportion of the present invention and proportion of the present invention of the present invention of the present invention and proportion of the present invention of the present invention and proportion of the present invention of the present invention of the present invention and proportion of the present invention and proportion o ö enables subclasses, diagnosis, prognosis, treatment and/or monitoring of harmatopoietic cell proliferative disorders. The present method enable a highly specific classification of harmatopoietic cell proliferative disorders allowing for improved and informed treatment of patients. Novel antisense compounds targeting nucleic acid encoding groEL or groES gene of microorganism, which hybridize with and inhibit expression of the genes, useful to inhibit growth of microorganism Claim 3; Page 50; 110pp; English. having the

The present invention specifically claims AAH56168 to AAH56832 which are antisense oligonucleotides to nucleotide sequences encoding groB. More

The invention relates to SAPL [SIT4-(sporulation-induced transcript4) associated proteins-likel polypeptide, selected from SAPLa polypeptide isoforms and SAPLa polypeptide isoforms. The SAPL polynucleotides are useful in gene therapy for treating and preventing insulin-dependent diabetes mellitus (IDDM). Fragments of the SAPL DNA are useful as primers and probes. The SAPL polypeptides are useful in screening for a substance e.g., a peptide or chemical compound, which interacts and/or binds with them. Sequences AAF83318-350 represent PCR primers specific for the SAPL

of 5-50 bases targeted to a nucleotide sequence encoding groEL (heat shock protein (HSP)60) (GL) and groES (HSP10) (GS) gene from a microorganism, where the antisense compound is complementary to GL or a microorganism and specifically hybridises with and inhibits the expression of GL or GS, is claimed. (I) have antibacterial, antiviral and antiprolliferative activities, and can be used in antisense therapy and for inhibition of expression of GL or GS in cells or tissues in vitro. (I) are also useful for inhibiting expression of GL or GS in cells or tissues in vitro. (I) are also useful for inhibiting the growth of a microorganism, or inhibiting the expression of GL or GS and concernation or inhibiting the expression of GL or GS and microorganism (a bacterial cell or a virus) having a GL or GS gene which involves administering to the microorganism or to a cell infected with the microorganism of CC a virus) having a mammalian pathological condition mediated by microorganism having a GL or GS gene which involves identifying a evexyotic organism or to a cell infected with the microorganism having a GL or GS gene which involves identifying a evexyotic organism or to a cell infected by microorganism having a GL or GS gene and administering (I) such that the growth of microorganism is inhibited. The antiense compounds are utilised for diagnostics, the microorganism having a GL or GS gene and administering (I) such that the growth of microorganism is inhibited. The antiense compounds are utilised for diagnostics, the prevent or delay microbial infections in humans. They are also useful as molecular weight markers. Addisologics on Addisologics or Addisologics or organism the present invention. They are used in the exemplification of the present invention.

Isoforms of novel gene arising from alternative splicing and encoding highly related proteins termed as SAPLa and SAPLb, from the IDDM4 locus on human chromosome 11q13, useful for treating IDDM and other diseases

```
The present sequence is a PCR primer used in a method for shuffling genes cry2Aa, cry2Ab and cry2Ac. Gene shuffling is a process for generating recombinant nucleic acids. Oligonucleotide assisted approaches can be used to produce family shuffled nucleic acids without isolating or cloning full-length homologous nucleic acids. Family gene shuffling oligonucleotides are provided by aligning homologous nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Recombining homologous nucleic acids to produce family shuffle nucleic acids comprises hybridizing and elongating a set of family gene shuffling oligonuclectides and providing a population of recombined nucleic acids -

ö
acid sequences to select conserved regions of sequence identity and regions of sequence diversity. A plurality of oligonucleotides are synthesized which correspond to at least one region of sequence diversity. In this example, the oligonucleotides were spiked into the assembling mix and PCR was then performed using the present primer. The method can be used to produce a family of shuffled mucleic acids, to produce recombinant molecules with greater molecular diversity and to generate classical mutagens. Homologous nucleic acids with low sequence similarity and non-homologous nucleic acids are also easily recombined.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, FCNA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme is useful for The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNR and Cyclin B1

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytchkine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule [11] comprising a promoter operally linked to a nucleic acid segment encoding [1]. [1] can have antipsoriatic, chuleic acid segment encoding [1]. [1] can have antipsoriatic, dermatological, cytostatic, antiseborrhaic, antidiabetic, antisickling, dermatological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. [1] can be used in gene therapy. [1] and [1] are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, appearance or seased for treating proliferative eye diseases such as diabetic retinopathy, virucoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AAM57577 to AAM62099 represent sequences used in the exemplification of the present invention.

```
(+)-delta-cadinene 8-hydroxylase (designated as CYP706B1), and the present inventor that the control of gossypol and related sesquiterpenes in cotton seeds through genetic engineering techniques. The polymucleotide sequence encoding CYP706B1 is useful in suppression of the biosynthesis of gossypol and related sesquiterpenes in cotton seeds, where the polymucleotide sequence is expressed in antisense or sense orientation as a perfect match to the native gene whose expression is sought to be suppressed. The polymucleotide sequence of the invention is useful for producing cotton cultivates which avoid the presence of sesquiterpenoids in their seeds, and for producing cotton seed product which is suitable for use as a feed for both livestack and humans.

The present sequence represents a PCR primer used to clone cDNA encoding cotton CYP706B1 in the examples of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel cotton (+)-gamma-cadinene 8-hydroxylase polypeptide designated as CYP706B1, useful as target for suppression of biosynthesis of gossypol formation in cotton seeds -

The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gane and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CpG dinucleotides within the target nucleic acid. ABZ09861 to ABZ1118 represent specifically claimed nucleotide sequences from the present invention. Oligomucleotides from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative disorder haematopoietic cells; for differentiating between acute upelogenous leukaemia; as probes for determining the cytcsine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder related sequences and their complements; and as primers for the related sequences and their complements; and as primers for the related sequences. The nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between subconderic cell proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative a highly specific classification of haematopoietic cell proliferative cell proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A method for the analysis of cDNA comprises (a) preparing an aggregate of mRNAs and represente of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GRNSES) (iles AAQ75547-07598) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAT47264-T47280 represent capped RNA molecules produced by the method of the invention is for producing capped RNA or RNA analogues. The method comprises reacting a RNA or analogue oligonucleotide with a phosphate addition agent to form a RNA or analogue mono., di- or triphosphate, which is then capped. The presence of the cap is important for mRNA maturation, initiation of translation, and protects the mRNA against various RNases present in the cell. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
novel sequence tagged site (STS) D13Sfk8. It produces a 143 bp amplicon when used with a D13Sfk8 forward primer (see AAT74212). Novel STS were isolated from murine beige (Bg) critical region yeast artificial chromosomes by interspersed repetitive element (IRE)-PCR (D13Sfk1-D13Sfk12) or by direct selection (D13Sfk13-D13Sfk19). Characterisation of the bg critical region in murine chromosome 13 and positional cloning of bg were performed as an antecedent to identification of the homologous human gene LYST1 (see AAT74201), which is mutated in human Chediak-Higashi syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Production of capped RNA or analogues - useful as substrates for influenza virus associated virally encoded endonuclease
                                                                                                                                                                                                                                                                                                                                                                                                                                               Ö

```
ó
capped RNA or analogue is an influenza endonuclease aptamer, useful for treating or preventing an influenza infection in an animal. The synthetic capped RNA are substrates for virally encoded endonuclease associated with influenza virus. The short non-extendible (due to their length or because of the modification of the 3' end of the oligo) RNA molecules are potent inhibitors of the cleavage of capped RNA by influenza endonuclease. They may be used to investigate viral and cellular mechanisms of transcription/translation, or mRNA maturation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01455). These ORFs anchode polypeptides (see AAY36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye trachomatis is responsible for a large number of diseases uch as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholnihits; pneumopathy in breast feeding infants; and veneraal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Vaccine; eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; PCR primer; bartholinitis; pneumopathy; venereal lymphogramulomatosis; ss.

These ORFs accode polygeptides (see AAY36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Attisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, and inclusion conjunctivitis; genital diseases such as mongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, hartholimitis; pneumopathy in breast feeding infants; and venereal lymphogramulomatosis. The polypeptides of the invention may be of use in treating these diseases.

C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent contributing factor in heart disease, sarcoidosis, sinusitis, purulent by the open reading frames of the C. pneumoniae genome (see AAX94584-AAX95879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.

The present PCR primer was used in the course of the invention. The specification describes Pyrococcus furiosus thermostable polypeptide factors. These factors bind to, and promote the DNA synthesis activity of DNA polymerase. The polymerase related factors can be used to provide more efficient in vitro DNA synthesis and amplification systems (e.g. for polymerase chain reaction) by using the factors in conjunction with a DNA polymerase.
                                                                                                                                                                                         Thermostable polypeptide factors promoting the activity of DNA polymerase - for improvement of DNA synthesis and amplification in

Amplification of a foreign gene by recombining close to a recombination hot spot and autonomously replicating sequence and culturing in the presence of a replication fork inhibitor protein for efficient foreign gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method for amplifying a foreign gene which comprises transferring the foreign gene into a host close to a recombination hot spot and an autonomoually replicating sequence and culturing it in the presence of a replication fork inhibitor protein. The replication fork inhibitor protein. The replication fork inhibitor proteins, and vectors containing them, can be used to produce recombinant proteins with increased efficiency. AAA38972 to AAA3895 represent PCR primers which are used in an example from the present invention.
                                                     The present PCR primer was used in the course of the invention. The specification describes Pyrococcus furiosus thermostable polypeptide factors. These factors bind to, and promote the DNA synthesis activity of DNA polymerase. The polymerase related factors can be used to provide more efficient in vitro DNA synthesis and amplification systems (e.g. for polymerase chain reaction) by using the factors in conjunction with a DNA polymerase.
                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Replication fork inhibitor protein, amplification, ARS, PCR primer, autonomously replicating sequence; recombinant protein, 88.
                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method for predicting the potential of an oligonucleotide to hybridise to a (complementary) target nucleotide sequence, involving identifying a subset of oligonucleotides within the predetermined number of unique oligonucleotides based on the evaluation of the parameter. Oligonucleotides in the subset are identified that are clustered along a region of the nucleotide sequence that is hybridisable to the target nucleotide sequence. This is useful for evaluating oligonucleotide probe sequences. The present sequence is an oligonucleotide described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Predicting the potential of an oligonucleotide to hybridize to a target nucleotide sequence, useful for evaluating oligonucleotide probe sequences, by identifying a oligonucleotides based on the evaluation of parameters
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present invention describes a method for predicting the potential of an oligonucleotide to hybridise to a (complementary) target nucleotide sequence, involving identifying a subset of oligonucleotides within the predetermined number of unique oligonucleotides based on the evaluation of the parameter. Oligonucleotides in the subset are identified that are clustered along a region of the nucleotide sequence that is hybridisable to the target nucleotide sequence. This is useful for evaluating oligonucleotide probe sequences. The present sequence is an oligonucleotide described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Predicting the potential of an oligomucleotide to hybridize to a target nucleotide sequence, useful for evaluating oligomucleotide probe sequences, by identifying a oligomucleotides based on the evaluation of

The present invention describes a method for predicting the potential of an oligonucleotide to hybridise to a (complementary) target nucleotide sequence, involving identifying a subset of oligonucleotides within the predetermined number of unique oligonucleotides based on the evaluation of the parameter. Oligonucleotides in the subset are identified that are clusterred along a region of the nucleotide sequence that is hybridisable to the target nucleotide sequence. This is useful for evaluating oligonucleotide probe sequences. The present sequence is an oligonucleotide described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method for predicting the potential of an oligonuclectide to hybridise to a (complementary) target mucleotide sequence, involving identifying a subset of oligonucleotides within the predetermined number of unique oligonucleotides based on the evaluation of the parameter. Oligonucleotides in the subset are identified that are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Predicting the potential of an oligonuclectide to hybridize to a target nuclectide sequence, useful for evaluating oligonuclectide probe sequences, by identifying a oligonuclectides based on the evaluation of parameters

The present invention specifically claims AAH56368 to AAH56832 which are antisense oligonucleotides to nucleotide sequences encoding groß. More generally, antisense compounds (I) comprising antisense oligonucleotides of 5-50 bases targeted to a nucleotide sequence encoding groß. (heat shock protein (HSP)60) (GL) and groß (HSP10) (GS) gene from a nicroorganism, where the antisense compound is complementary to GL or GS of a microorganism and specifically hybridises. with and inhibite the expression of GL or GS, is claimed. (I) have antibacterial, antiviral and antiproliferative activities, and can be used in antisense therapy and for inhibition of expression of groß or groß. (I) are useful for inhibition the growth of a microorganism, or inhibiting the growth of a microorganism, or inhibiting cross useful for inhibiting the growth of a microorganism, (I). (I) are a virus) having a GL or GS gene which involves administering to the microorganism or to a cell infected with the microorganism cross a cell infected with the microorganism or to a cell infected with the microorganism or to a cell infected with the microorganism swinch involves identifying a cukaryotic organism having a pathological condition mediated by microorganism and the advisory or antiple organism which involves deminisms having a GL or GS gene with the microorganism or to a cell infected with the microorganism which involves identifying a cukaryotic organism having a pathological condition mediated by microorganism and the advisory or antiple or the average or a pathological condition mediated by microorganism and the advisory or antiple or and the microorganism and the advisory or antiple or and the microorganism and the advisory or antiple or and the microorganism and the advisory or antiple or and the microorganism and the advisory or antiple or and the microorganism and the advisory or antiple or and the microorganism and the advisory or antiple or and the advisory or antiple or and a cell inference or and the advisory or antiple or and a cell
  is hybridisable

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel antisense compounds targeting nucleic acid encoding großL or großS gene of microorganism, which hybridize with and inhibit expression of the genes, useful to inhibit growth of microorganism having the genes -
clustered along a region of the nucleotide sequence that is hybric to the target nucleotide sequence. This is useful for evaluating oligonucleotide probe sequences. The present sequence is an oligonucleotide described in the exemplification of the invention.
                                                                                                                                                                                                                                              .

The method is useful in the medical, biochemical, molecular biological and generic engineering fields. Sequences ABQ79871-881 represent PCR primers used in the method of the invention.
or GS gene and administering (I) such that the growth of microorganism is inhibited. The antisense compounds are utilised for diagnostics, therapeutics, prophylaxis and as research reagents and kits, e.g., to prevent or delay microbial infections in humans. They are also useful as molecular weight markers. AAH56362 to AAH56567 and AAH56833 to AAH56854 exemplification of the present invention. AAH56855 to AAH56897 exemplification of the present invention. AAH56855 to AAH568970 represent groß nucleotide sequence given in the present invention.
                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Carrying out a thermal cycle of polymerase chain reaction (PCR) by using a substrate on which a DNA is immobilized used in medical, biochemical, molecular biological and gene engineering fields
                                                                                                                                                                                                                         ö
                                                                                                                                                                                          Length 20;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polymerase chain reaction, thermal cycle, immobilisation, genetic engineering; PCR; primer; ss.

The invention relates to a compound 8-50 nucleobases in length targeted to a nucleic acid molecule encoding casein kinase 2-alpha. The compound specifically hybridises with and inhibits the expression of casein kinase 2-alpha, or specifically hybridises with at least an thinase 2-alpha, or specifically hybridises with at least an 8-aucleobase portion of an active site on a nucleic acid molecule encoding casein kinase 2-alpha i.e. an antisense oligonucleotide.

Also included are: (1) a composition comprising the compound and a carrier or diluent; (2) inhibiting the expression of casein kinase carpha in cells or tissues by contacting the cells or tissues with the novel compound; and (3) treating an animal having a disease or condition associated with casein kinase 2-alpha by administering to the animal the compound cited above so that expression of casein kinase 2-alpha is compound cited above so that expression of casein kinase 2-alpha is conficted any and compounds are useful for modulating the expression of casein kinase 2-alpha and for treating diseases or conditions associated with expression of casein kinase 2-alpha, e.g. diabetes or hyperproliferative disorder, particularly cancer, such as breast cancer, prostate cancer, or liver cancer. The antisense breast cancer, prostate cancer, or liver cancer. The antisense compounds are also useful for diagnostics, therapeutise, prophylaxis, compounds are also useful for diagnostics, therapeutise, prophylaxis, compounds are also useful for diagnostics, therapeutise, prophylaxis, casearch reagents and kits, and in distinguishing between functions of various members of a biological pathway. The present equence is a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antisense oligonucleotides targeted to nucleic acid encoding casein kinase 2-alpha, useful in diagnostic and research applications, or for treating a disease or condition associated with expression of casein kinase 2-alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 3; Page 95; 166pp; English

cc 20013. CAS has been implicated in the regulation of mitosis, apoptosis and cellular proliferation and is highly expressed in some cancer cells. CAS has also been shown to mediate export of importin-alpha is a nuclear import receptor for nuclear nucleus. Importin-alpha is a nuclear import receptor for nuclear cansort is involved in cell cycle defects. The antisense compounds specifically hybridise with, and inhibit expression of the gene or specifically hybridise with an 8 nucleobase portion of its active site. The antisense compounds are useful for inhibiting the expression of a cellular apoptosis susceptibility gene in cells or tissues and for treating an animal having a disease or condition associated with a cellular apoptosis susceptibility gene, where the disease or condition is a hyperproliferative disorders such as ancer, preferably breast or colon cancer, degenerative disorders such as ancer, preferably breast or colon cancer, degenerative disorders such as Alzheimer's disease, Parkinson's concer, degenerative disorders such as ancer, preferably breast or colon cancer, degenerative disorders such as sancer, preferably breast or colon cancer, degenerative disorders such as alzheimer's disease, anytirophic lateral sclerosis (Ais), retinitis pigmentosa and blood cell disorders. The compounds are also useful for diagnostics, therapeutica, prophylaxis, as research reagents and kits, for the prophylaxis, as research reagents and kits, for antisense gene therapy and prophylactically (e.g. to prevent or delay inference therapy and prophylactically (e.g. to prevent or delay inference in ABSS9252-ABSS9322 are targeted to the human CAS gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, antisense gene therapy, Syntaxin 4 interacting protein; ss,

expression of Syntaxin 4 interacting protein in cells or tissues. The antisense oligonucleotides are also useful for treating an animal having a disease or condition associated with Syntaxin 4 interacting protein (e.g. diabetes, obesity or a skeletal muscle disorder). The antisense oligonucleotides can also be used to prevent or delay infection, inflammation and tumour formation. The present DNA sequence represents a human Syntaxin 4 interacting protein antisense oligonucleotide.

NOTE: The present sequence contains a phosphorothicate backbone and 2'-0-methoxyethyl wings. Human translocating chain-associated membrane protein, RT-PCR primer #2. New human transposition chain related membrane protein and its coding Human; translocating chain-associated membrane protein; BioTRAM; i.1%; Score 14.2; DB i; Length 20 84.2%; Pred. tumour, The invention relates to a novel human translocating chain associating membrane protein (BioTRAM), polynucleotides encoding this polypeptide praces used to produce the polypeptide. The present invention also discloses the method of applying the polypeptide and polynucleotides in treating immunological disorder, malignant tumour cancer and other diseases. The antagonist resisting the polypeptide and its treatment effect is also disolosed. Diagnosis and determination method based on the discrimination of the mutation in the nucleic acid sequence and the change in the polypeptide expression level, and the application of the polypeptide septession level, and the sequence represents a reverse transcriptase (RT)-PCR primer used to isolate the coding sequence of the novel human BioTRAM protein as described in the invention.

New compound that hybridizes with and inhibits the expression of Phospholipase A2, group IIA, useful for preparing a composition for treating or preventing inflammation, cancer, psoriasis or diabetes

Claim 3; Page 89; 135pp; English.

The present invention describes a compound (I) comprising 8-50 nucleobases which is targeted to a 5' untranslated region (UTR). Coding, 19 untranslated region (UTR). Coding, 19 untranslated region of a nucleic acid molecule encoding phospholipase 3' group IIA (synovial), where the compound specifically hybridises with and inhibits the expression of phospholipase A2, group IIA (synovial).

Also described: (I) a composition comprising the compound and a carrier or diluent; (2) a method of inhibiting the expression of phospholipase A2, group IIA in cells or tissues, and (3) a method of treating an animal having a disease or condition associated with phospholipase A2, and antipsoriatic activities, and can be used in vaccines and in gene threapy. The compound (I) can be used for preparing a composition for treating or preventing inflammation, cancer, psoriasis or diabetes. The present sequence represents a mouse phospholipase A2 group IIA (synovial)

diabetes, multiple sclerosis,

```
autoimmune arthritis, autoimmune insulinitis or crohn's disease), cancer, or a disease/disorder caused by aberrant apoptosis. They are also useful for diagnostics, therapeutics, prophylaxis or as research reagents or kits. The invention is useful in gene therapy. The present sequence is an antisense oligonucleotide targetted to human IFNGR2 DNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to antisense compounds, composition and methods for modulating the expression of human interferon gamma receptor 2 (IFWGR2). The compositions comprise antisense compounds targetted to nucleic acids encoding IFWGR2. Antisense compounds invention are useful for treating diseases or conditions associated with IFWGR2, e.g. autoimmune
chimeric phosphorothioate antisense oligonucleotide, which is used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense oligonucleotides for modulating Interferon gamma receptor 2, particularly useful for treating autoimmune disorders (e.g. multiple sclerosis or Crohn's disease), cancers or diseases caused by aberrant

The methods and compositions of the invention are useful in the field of plant molecular biology, in particular plant insect protection and plant breeding. The MONI5985 event confers resistance to Lephopteran insect damage. The present sequence is 3, end of the cotton genomic remnant DNA. This sequence is used in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                       Human TNR-alpha hammerhead ribozyme target sequence (nt position 1269).
                                                                                                                                                                                                         Gaps
         ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit TNF-alpha expression, making them potentially useful for treating rheumatoid arthritis, septic shock and other inflammatory disorders including psoriasis, as well as for treatment of AIDS.

(Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Bnzymatic nucleic acid; ribozyme; trans cleavage; inhibition; gene expression; downregulation; interleukin-5; IL-5; ICAM-1; intercellular adhesion molecule; rel A; tumour necrosis factor; TMF-alpha; respiratory syncytial virus; RSV; bcr-abl; oncogene; translocation; chronic myelogenous leukaemia; CML; cancer; philadelphia chromosome; inflammation; autoimmune disease; atherosclerosis; myocardial infarction; stroke; restenosis; transplant rejection; theumatoid arthritis; psoriasis; myocardial ischaemia; Kawasaki disease; septic shock; HIV; human immunodeficiency virus; acquired immune deficiency syndrome;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human TNF-alpha bammerhead ribozyme target sequence (nt position 1258).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                               Stinchcomb DT, Chowrira B, Direnzo A, Draper KG, Dudycz LW; Grimm S, Karpeisky A, Kisich K, Matulic-adamic J, Meswiggen JA; Modak A, Pavco P, Beigleman L, Sullivan SM, Sweedler D; Thompson JD, Tracz D, Usman N, Wincott FB, Woolf T;
                                                                                                                                                                                                                                                                      The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves TNF-alpha mRNA at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and Hairpin structures and that contain potential hammerhead and Hairpin ribozymes cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit TNF-alpha expression, making them potentially useful for treating rheumatoid arthritis, septic shock and other inflammatory disorders including psoriasis, as well as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Enzymatic nucleic acid; ribozyme; trans cleavage; inhibition; gene expression; downregulation; interleukin-5; LL-5; ICMM-1; intercellular adhesion molecule; rel A; tumour necrosis factor; TWF-alpha; respiratory syncytial virus; RSV; bcr-abl; oncogene; TAFAnallocation; chronic myellogenous leukaemia; CML; cancer; Philadelphia chromosome; inflammation; autoimmune disease; atherosclerosis; myocardial infarction, stroke; restenosis; myocardial infarction; stroke; restenosis; myocardial infarction; stroke; sextenosis; myocardial ischaemia; Ramsabai disease; septic shock; HIV; human immunodeficiency virus; acquired immune deficiency syndrome;

```
The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves FNF-alpha mRNA at the nucleotide base position indicated in the DE line.

Or sequence of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis.

Or Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit TNF-alpha expression, making them potentially useful for treating rheumatoid arthritis, septic shock and other inflammatory disorders including psoriasis, as well as the target of treatment of ALDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel isolated nucleic acid molecule comprising a variant gene associated with an eating disorder and selected from any of 119 polymorphisms with their corresponding genotyping in dataset, alleles and HGBASE identification, given in the specification. The novel nucleic acid molecule has polymorphisms in the serotonin receptor ID, delta-opioid receptor, or dopamine receptor D2, which is useful in diagnostic and prognostic assays for eating disorders, in particular anorexia nervosa and bullmia nervosa. This polymucleotide sequence represents a hypocretin receptor I PCR primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid molecule having polymorphisms in the serotonin receptor 1D, delta-opioid receptor, or dopamine receptor D2, useful in diagnostic and prognostic assays for eating disorders, such as anorexia

for treating cancers

```
The present invention describes enzymatic nucleic acid molecules (NAMS) which specifically cleave RNA derived from an epidermal growth factor receptor (EGR-R) gene. ARV9721 to AAV99633 and AAV9989 to AAV99090 represent specifically claimed target sequence from human BGP-R. AAV9804 to AAV98866 and AAV98867 to V9878 represent hammerhead ribozymes and halpin ribozymes respectively for human BGP-R. The NAMS are useful for cleaving SGP-R RNA in the treatment of a condition associated with EGPR expression levels e.g. to inhibit cell proliferation in the prevention or treatment of cancers. The NAMS can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of BGP-R RNA in a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Buman, aryl hydrocarbon nuclear transport, ARNT, TIE-2, angiogenesis; integrin alpha 6 subunit, integrin subunit beta 3; hairpin ribozywe; harmerhead ribozywe; angiogenic factor; cytostatic; antidiabetic; ophthalmologic; antiinflammatory; antiathritic; antipsociatic; ARMD; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; periasis; verrue andiotibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; Osler-Weber-Rendu syndrome; ss.

```
The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl Nydrocarbon nuclear transporter (ARNY) gene, an integrin subunit beeta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17165 to AAA1768 to AAA1768 to AAA1767 to AAA1768 to AAA19677 to AAA19155 to AAA1922. represent their corresponding target sequences; AAA1768 to AAA1918 to AAA1918 to AAA1768 to AAA1768 to AAA1918 to AAA1768 to AAA1768 to AAA1818 to AAA1918 to AAA2168 to AAA1768 to AAA2168 
                                                                                                                                                                                                                                                                                                                                                                  Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        integrin subunit alpha-6, or integrin subunit beta-3

Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors

Claim 54; Page 243; 305pp; English

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNY) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA1575 to AAA1761 and AAA1762 to AAA1762 represent ribozyme sequences for ARNY, corresponding target sequences, AAA1963 to AAA1963 and AAA1963 to AAA1963 to AAA1963 and AAA1963 to AAA2168 to Expresent their corresponding target sequences; AAA19623 to AAA2168 to Expresent their corresponding target sequences; AAA21689 to AAA21681 and AAA2160 to AAA2169 to AAA22169 to AAA2169 integrin subunit alpha-6, or integrin subunit beta-3.

A method has been developed for detecting the presence or absence of a single nuclectide polymorphism (SNP) allele in a genomic sample. The method comprises preparing a reduced complexity genome (RCG) from the genomic sample and analysing the RCG for the presence or absence of a SNP allele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or to generate a genomic classification code for a genome. The method can be used to assess whether a subject is at risk for developing a disease or to identify a set of SNP alleles associated with a disease. The method can also be used to perform linkage analysis. AAA35944 to AAA35947 represent sequences used in the exemplification of the present invention. AAA35948 to AAA36532 represent nucleotide sequences containing SNPs.
                                                                                                                                                                                                                                                                                                                                                                                                                                          Detection of single mucleotide polymorphisms in genomes by preparation and analysis of reduced complexity genomes, useful for genotyping, fingerprinting and determining allele frequency of SNPs
                                                                                            Human; single nucleotide polymorphism; SNP; genotyping; DNA analysis; allele specific oligonucleotide; ASO; reduced complexity genome; RCG; genomic classification; identification; DNA fingerprinting; tumour characterisation; hybridisation; 8s.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of bortein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 mucleic acids in samples, as amplification unbertates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific blownlecule capture probes for surface-enhanced laser desorption concentration, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for therapy. The planucleotide sequences encoding hGDMLP-1 may be used for therapy. The present and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomen used in the screening of the hGDMLP-1 sequence in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             invention.

New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1

Disclosure; SEQ ID 7603; 214pp; English.

The present invention describes a human genome-derived myosin-like protein 1 (hGDWLP-1). The protein and polymucleotide sequences of hGDWLP-1 can be used in gene therapy and vaccine production. The hGDWLP-1 mucleic acids can be used as probes to detect, characterise and quantify hGDWLP-1 mucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDWLP-1 proteins. The hGDWLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDWLP-1 proteins, as standards in assays used to determine the hGDWLP-1 proteins, as specific concentration and/or amount specifically of hGDWLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption concentration and/or amount specifically of hGDWLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption confering in hGDWLP-1 production, and in vaccines or for replacement the polymucleotide sequences encoding hGDWLP-1 may be used for diagnosing a disorder associated with the expression of hGDWLP-1; in chart and skeleral muscle disorders. hGDWLP-1 in production, and disorder used in the chromosome 22. The present sequence in the exemplification of the present

invention.

N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence.

PCR primer used to amplify the human krit1 gene exon 4.

Human, krit1 gene, Ras gene, cavernoma; gene therapy, angiogenesis, vascular malformation, dysplasia; angioma; tumour; PCR primer; ss.

(INRM) INSERM INST NAT SANTE & RECH MEDICALE.

Tournier LE, Laberge Le Couteux S, Labauge P;

New primers for amplifying regions of the Kritl gene, useful for diagnosis, particularly by detecting mutations, cavernomas, and therapy with this gene

Claim 1; Page 16; 39pp; French.

PCR primers AAF24944-45 were used to amplify exon 4 of the human kriti gene. Kriti is a member of the Ras gene family. Mutations in the kriti gene are responsible for certain vascular abnormalities. The primers are used to detect mutations in the Kriti gene, specifically those mutations that are associated with presence of cavernomas, for diagnosis. The kriti gene, or its derivatives, are useful in gene therapy for controlling or inhibiting angiogenesis, e.g. in cases of vascular malformation or dysplasia, or angioma, and the Kriti protein, optionally modified, may be used similarly, particularly for treatment of tumours.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequences were determined from the ends of chromosome 11-specific cosmids by automated sequencing without intermediate subcloning.

A sample of 371 DNA sequence fragments were determined and of these, 277 were suitable for STS primer prediction by computer analysis (using the "Primer" program available from E.Lander, MIT).

The STSs and crosmids were mapped by in situ hybridisation, somatic cell hybrid analysis or both. Using this method, 370 STSs specific for human chromosome 11 were generated and most of them were sequencing complex genomes, designated "sequence sampled mapping". The sequence sampled mapping method is useful for the completion of high density sequence based maps, and ultimately, for the complete sequencing of genomic DNA directly from cosmid clones.

AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent by the open reading frames of the C. pneumoniae genome (see AAX94584-AAX95879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae muclectides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Novel antisense oligonucleotides used for inhibition of
Mitogen-activated protein kinase kinase 6 expression
```

Example 15; Column 41; 33pp; English.

The invention provides antisense oligonucleotides which are targeted to an unclaid acid encoding a mitogen-activated protein kinase (MPAE) kinase 6. The antisense oligonucleotides are used to inhibit MAPK kinase expression, and so are used to treat diseases mediated by MAPK kinase 6 expression. They may also be used to detect MAPK kinase 6, e.g. in sandwich assays. Sequences AA289558-597 represent antisense oligos inhibiting human MAPK kinase 6 mRWA.

New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species varieties

Claim 6; Page 51; 72pp; English.

The invention relates to a substantially purified or isolated nucleic acid (I) from ryegrass or fescue species including a simple sequence repeat (SSR), having 2 or more tandemly repeated nucleotide core elements 2-6 nucleotides in length. Also included are a nucleic acid primer suitable for amplifying an SSR, identifying (M1) an SSR by preparing a library of ryegrass or fescue genomic DNA enriched for SSRs and identifying clones in the library containing SSRs, a library of ryegrass or fescue genomic DNA enriched for selecting for fescue genomic DNA enriched for SSRs prepared by the M1, selecting for

a gene in grass or cereal breeding by identifying an SSR that is closely associated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a method for DNA profilling grass or cereal species varieties by assessing variation between SSR varieties and testing the purity of grass or cereal seed batches by assessing variation within seed batch of an SSR. The SSRs may be used in the selection of genes in grass or cereal sheeding, for profilling grass or cereal species varieties, for testing the purity of grass or cereal seed batches, and for DNA profilling to establish the distinct identity, uniformity and/or stability of a cultivar. The present sequence is a ryegrass or fescue SSR.

New system for leukocyte expression profiling, diagnosing a disease, or monitoring (the rate of) progression of a disease, e.g. atherosclerosis or congestive heart failure, comprises diagnostic oligonucleotides

Claim 1; Page 389; 2038pp; English.

The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ08152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, then allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus,

The c-myb sequence was screened for optimal ribozyme target sites using a computer folding algorithm, and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes cleave the c-myb sequence and can be used to prevent smooth muscle cell hyperproliferation in restenosis, especially after coronary angioplasty, and in cancers.
                                                                                Gaps
                                                                                                                                                                                                                                                                                   Human c-myb hammerhead ribozyme target sequence (nt. position 2713).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New enzymatic nucleic acid molecules - which cleave RNA produced by e.g. c-myb, for treating restenosis or cancer
rheumatoid arthritis, osteoarthritis or cytomegalovirus infection.

```
The present invention describes enzymatic nucleic acid molecules with RNA-cleaving activity (e.g. ribozymes) which are capable of modulating the expression of plant genes: (i) involved in biosynthesis of AAV96334, and AAV96335 to AAV96335 to AAV96335 to AAV96335 to AAV96335 to AAV963569 to AAV96331, and AAV96355 to AAV963569 to AAV963981, and AAV96355 to AAV96734 represent potato solanidine glucosyltransferase target sequences. AAV9673 to AAV97170, and AAV97171 to AAV97195 to Experesent potato citrate synthase hammerhead and halriph ribozymes. respectively. AAV96735 to AAV97772, and AAV97719 to AAV97195 cortato citrate synthase hammerhead and halriph in inozymes. respectively. AAV96735 to AAV96773, and AAV97719 to AAV97720 represent potato citrate synthase synthesis of the present cortato and be used to inhibit the synthesis of toxic alkaloids in incortants, particularly potato but also tomato, pepper. and citrate synthase is of toxic alkaloids in cabergine and ditura or to inhibit flowering in potato, lettuce, spinach, cabergine and ditura or to inhibit flowering in potato, lettuce, spinach, cabergine and turf grass. Also the ribozymes can be used for RNA manipulation in the same way that restriction endonucleases are for DNA, as well as to examine genetic drift and mutations in plants and to consenus sequences within a family of related genes, and being to catalytic need to be present at only very low concentrations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an anglogenic factors

Claim 56; Page 132; 305pp; English.

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl Phydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 gene, and AAA17167 and AAA17167 to AAA17167 and AAA17621 to AAA17621 to AAA17684 tepresent their corresponding target sequences; AAA17685 to AAA18385 and AAA19086 to AAA19154 represent ribozyme sequences for Tie-2, and AAA19087 to AAA19154 represent ribozyme sequences for Tie-2, and AAA19087 to AAA19223 represent their corresponding target sequences; AAA19223 to AAA19222 represent their corresponding target sequences; AAA19223 to AAA19222 represent their corresponding target sequences; AAA19225 to AAA21688 represent their corresponding target sequences; AAA21689 to AAA21685 and AAA21685 represent their corresponding target sequences; AAA21689 to AAA21689 to AAA21689 to AAA21689 to AAA21689 to AAA21689 represent their corresponding target sequences; Cfor integrin subunit beta 3, and AAA22476 to AAA23262, AAA23333 to the invention are used for modulating the synthesia sequences; creability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit beta 3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARND), inflammation, and atthritis, as well as macular degeneration (ARND), inflammation, and atthritis, werder ungarias; cancer diabetic retinopathy, escape related to the levels of ARNT, Tie-2, integrin shumit allaha-6, or the levels of ARNT, Tie-2, integrin shumit allaha-6, or integrin syndrome, syndrome, syndrome, syndrome integrin subunit alpha-6, or integrin subunit beta-3.

```
A method has been developed for the identification of a nucleic acid capable of modulating a process in a biological system. The method comprises: (a) introducing into the system a random library of nucleic acid catalysts (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with endonuclease activity and catalytic activity, from the present

ö
invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases caused by specific RNA. e.g. ancer, inflammation, psoriasis, non-hepatic ascites and infection. They may also be used to detect genetic drift and mutations in diseased cells and to determine expression of the Raf gene, are used to treat cancer, restencesis, psoriasis or rheumatoid arthritis, or generally any condition associated with the level of c-raf. Introduction of sugar/phosphate modifications increases stability against nuclease and activity. AAV90922 to AAV93877 represent NACs that can be used in the method, specifically for modulating the expression of a Raf gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of represor genes encoding the TR2 Orphan receptor. EARJ/COUP-TF-1, the GATA transcription factor gene, TRR-2 and/or the CAAT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha.
                                                                                                                                                                                                                                                                                                                      Gaps

with a target sequence and contain at least one phosphoro(di)thicate link, having endounclease activity. (A), and more generally any catalytic mucleic acid (A*) that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or receptor gene, are used to treat cancer (particularly of breast or reated cells, or for other conditions sesociated with levels of cestrogen receptor. Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with also be used to correlate inhibition of gene expression with cargets, and as research reagents (for RNA, in the same way that targets, and as research reagents (for RNA, in the same way that restriction endomucleases are used with DNA). The combination of modifications in (A) improves resistance to nucleases binding affinity and/or activity. AAA21503 to AAA21477 represent oestrogen receptor hammerhead ribozyme sequences, and AAA21610 to AAA2610 represent corresponding target sequences, and AAA2610; to AAA2611 represent cetrogen receptor hairpin ribozyme sequences. AAA28219 to AAA2611 represent other ribozyme sequences and antisense oligonucleotides used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         present invention describes nucleic acids (A) that interact stably

The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro (di)thioate link, having endowuclease activity. (A), and more generally any catalytic nucleic acid (A) that modulates expression of the cestrogen receptor gene, are used to treat cancer (particularly of breast or receptor gene, are used to treat cancer (particularly of breast or receptor gene, are used to treat secondated with levels of treated cells, or for other conditions associated with levels of can also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that restriction endonucleases are used with DNA). The combination of modifications in (A) improves resistance to nucleases, binding affinity and/or activity, AAA23503 to AAA24747 represent centrogen receptor hairboryme sequences, and AAA2593 to AAA2592 represent their corresponding target sequences, and AAA25919 to AAA2592 represent their excresponding target sequences, and AAA25919 to AAA2592 represent their corresponding target sequences, and AAA25919 to AAA2592 represent their corresponding target sequences, and AAA25919 to AAA2592 represent their corresponding target sequences, and AAA25919 to AAA2592 represent their corresponding target sequences. AAA25919 to AAA25921 represent their corresponding target sequences. AAA25919 to AAA25921 represent other their corresponding tearget sequences. AAA25919 to AAA25921 represent their corresponding tearget sequences and adaptisents of in the

```
The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thioate link, having endomiclase activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the cestrogen receptor gene, are used to treat cancer (particularly of breast or reated cells, or for other conditions associated with levels of cestrogen receptor. Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with a laterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that a restriction endomucleases are used with DNA). The combination of modifications in (A) improves resistance to nucleases, binding affinity and/or activity. AAA23503 to AAA24747 represent oestrogen receptor harmerhead riboxyme sequences, and AAA26103 to AAA2618 represent cereptor harmpin riboxyme sequences, and AAA26107 to AAA2618 represent cereptor their corresponding target sequences, and AAA26107 to AAA2618 represent cereptor their corresponding target sequences, and AAA26107 to AAA2618 represent cereptor their corresponding target sequences, and AAA26107 to AAA2618 represent cereptor their corresponding target sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antigense oligonucleotides used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      other ribozyme sequences and antisense ol exemplification of the present invention.

```
The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL chas two isoforms, with a few single base pair differences between the two isoforms, with a few single base pair differences between the two of the single base pair changes introduces a premature stop codon in HTPL-8 (8 for short) compared to HTPL-1 (1 for long). HTPL canners an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was important in regulating male germ cell development, and the HTPL, and in therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of the HTPL. Such disorders include disorders expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foctal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from. the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1.1%; Score 13.8; DB 1; Length 17;

The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLCA1) genes conjusted from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell, hence, are useful for treatment of a patient having a condition associated with the level of CLCA1, where the invention further comprises the use of one or more therapy bronchodilators conticosteroids, the use of one or more therapy bronchodilators corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The nucleic acids of the invention are also used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of CLCA1, RNA in a cell. This sequence represents an

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The mucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ65216, ABZ64544 - ABZ65531, ABZ6520 - ABZ65216, ABZ65530 - ABZ6530 - ABZ65530 - ABZ65 Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, wodulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences Gaps A. thaliana plant morphogenesis regulatory protein RT-PCR primer.                                                                                                                                                                                                                      The present sequence is a RT-PCR primer for a mRNA encoding an Arabidopsis thaliana plant morphogenesis regulatory protein (MRP), which can be used to yield a plant with, e.g. short stems or altered inflorescence. The MRP acts on a plant at a specific site for a specific period, and can therefore be used to regulate extraneous gene expression in a plant. The MRP's cDNA or genomic DNA can be used to transform a plant to increase its MRP expression, and therefore control the form (particularly stem length) of the plant.

AXX09121-X10268 are allele-specific cligonuclectide primers used in the isolation of various biallelic polymorphic markers found in the human genome (represented in AAX10269-X1293). These primers can be used in a method for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidual, Lesch-Nyhan syndrome, con use and as agammaglobulinemia, diabetes insipidual, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Pabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, you Willebrand's disease, thereditary spherocytosis, you Willebrand's disease, thereditary syndrome, osteogenesis imperfecta, acute intermittent porphyria, autorimmune diseases, inflammation, cancer, diseases of the nervous syndrome, osteogenesis inflammation, cancer, diseases of the nervous as longerity, appearance (e.g. baldness, obesity), strength, speed, as longerity, and susceptibility or receptivity to particular dungs or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or prophylaxis of such diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PCR; primer; amplification; endocervical; cloacal; sputum; 16S rRNA; ss.

The any of the same time without losing its sensitivity and specificity. This at the same time without losing its sensitivity and specificity. This at the same time without losing its sensitivity and specificity. This is and and possible by the usage of three 16s IRRN species specific primers pairs (AAV17953-V17956). The optional first step subjects the test sample to a PCR reaction which uses the Chlamydia genus specific 16s IRNA sense and antisense (AAV17952) primers to amplify the generic 16s IRNA sense and antisense (AAV17952) primers to amplify the generic 16s IRNA sense and antisense (AAV17952) primers to amplify the generic 16s IRNA subjected to another PCR reaction with the species specific primers. The type of Chlamydia species present is indicated by the length of the PCR product. A 412 bp product would indicate C. pneumoniae and a 127 bp product would indicate C. pneumoniae and a 127 bp product would indicate C. pneumoniae and a 127 bp product would indicate C. psittaci. These primers can also the used as species specific probes. The assay can be used to equally identify e.g. C. trachomatis from endocervical swab samples, C. psittaci from cloacal swab samples from birds and C. pneumoniae from sputum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel biallelic markers used to construct a high density disequilibrium
             invention provides a novel assay for detecting and differentiating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human biallelic marker downstream amplification primer SBQ ID NO:9394.

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density

AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the development of pharmaceutical agents and diagnostic methods, as well as the
mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoing a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1

The patent discloses methods for screening an individual for increased risk of low folate status. The method involves detecting a mutation in the human glutamate carboxypeptidase (GCP) II gene in a biological sample from said individual, wherein detection of the mutation is indicative of decreased ability of an individual to hydrolyge terminal glutamate residues from dietary folates by folypoly-gamma-glutamate carboxypeptidase (FGCP), a product of GCPII gene. The decreased ability is associated with low folate status. The method is useful for screening an individual for increased risk of low folate status and conditions cancer and altered cognition in the elderly including Alzheimer's disease. Pregnant women with low folate status are at increased risk of bearing children with neural tube defects and congenital heart defects. The primer which is used for amplifying exon-4 of GCPII gene. This primer is designed from PSWA amplifying exon-4 of GCPII gene. This primer is designed from PSWA genomic sequence and is used for detecting a mutation in GCPII gene.

Haematopoietic cell proliferation disorder related oligonucleotide #735.

(first entry)

16-JAN-2003

Human; haematopoietic cell proliferation disorder; cytostatic; gene therapy; lymphocytic leukaemia; acute myelogenous leukaemia; cytosine methylation state; probe; primer; ss.

```
The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinse (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promote poperably linked to a nucleic acid segment encoding [1]. (I) can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vytostatic, acidical and virucide activities, and cleaves RNA encoding (II) and have useful for treating proliferative cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and rectinal detachment, and for treating and preventing prematuring scarr. AAHS1577 to AAH62099 represent sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
Human, ribozyme therapy; hairpin ribozyme; hammerhead ribozyme; recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; skin disease; skin disease; skin disease; skin disease; cyclinis diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MMP; antipsoriatic; dermatological; artiseborrheic; antidiabetic; virucide; antistokling; ophthalmological; artiseborrheic; antidiabetic; virucide; antistokling; ophthalmological; keratolytic; gene therapy; viral wart; atopic dermatitis; actinic keratosis; squamous cell carcinoma; basal cell carcinoma; seborrheic wart; vitreoretinopathy; scar; sickle cell retinopathy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regularory regions in a subject. The method comprises contacting a target nucleic acid in a bological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CpG dinucleotides within the target nucleic acid ABZD3861 to ABZ1118 represent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative disorder haematopoietic cells; for differentiating between acute lymphocytic leukaemia and acute myelogenous leukaemia; as probes for determining the cyrosine methylation state and/or single nucleotide polymorphisms (SNPB) of haematopoietic cell proliferation disorder related polymorphisms (SNPB) of haematopoietic cell proliferation disorder related missorder camplification of haematopoietic cell proliferation of sectoring a predisposition to, differentiation between also be used for detecting a predisposition to, differentiation between consumption can be used for detecting a predisposition to, differentiation between a highly specific classification of haematopoietic cell proliferative call proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative disorders.

The Ligase Chain Reaction has been improved to increase the
"flexibility" or "dynamic range" of each probe set used in the
detection of small mutations (single base deletions, insertions and
changes, as well as multiple mutations where the size of the
mutation is less than about 15% of the average probe length).

Previously the determination of the genetic constituency of an
individual has been time consuming. The invention comprises reacting
probes and sample (suspected to contain the target nucleic acid)
under hybridising conditions that have been modified - 1. the
concentration of monovalent cation (Na+, K+, or NR3H+; R = H or
lower alkyl) is 100-200mM; 2. "hot start" (temp. range 50-95
ce degree C) may be used; and 3. one of the downstream probes has a
mismatch within 5 bases from the 5' end so it is not complementary
to the target sequence (The complementary probe is also mismatched).
These may be used either on their own or in conjunction.
AAG62245 and AAG62246 are used to detect the G551D mutation in
cystic fibrosis. The remaining probes are selected from AAG62247-50.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ligase Chain Reaction - specific probe for CF mutation detection.
                                                                                                                                                                                                                                                        Improved ligase chain reaction with high monovalent cation conoras, mismatched probes and/or high initial mixing temps - used to detect small mutations in known DNA sequences, pref. for detecting cystic fibrosis mutations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cystic Fibrosis, CF missense mutation; improved method;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Two primer sets are used for detecting at least two mutations characteristic of cystic fibrosis, each set comprises two primer pairs: pair Pl comprises a primer specific for a normal allele and pair P2 comprises a primer specific for a mutant allele, each pair further comprises a common primer. PCR is performed on genomic DNA using both primer specific for a mutant allele indicates the likelihood that the parient carries a mutant allele indicates the likelihood fibrosis phenotype. This primer is designated G551D-N and is the primer see AAQ47990 and AAQ47992).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        쉼
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                 The Ligase Chain Reaction has been improved to increase the "flexibility" or "dynamic range" of each probe set used in the detection of small mutations (single base deletions, insertions and changes, as well as multiple mutations where the size of the changes, as well as multiple mutations where the size of the mutation is less than about 15% of the average probe length). The previously the determination of the genetic constituency of an individual has been time consuming. The invention comprises reacting probes and sample (suspected to contain the target mucleic acid) individual has been time consuming. The invention occupies reacting probes and sample (suspected to contain the target mucleic acid) concentration of monovalent cation (Na+, K+, or NRJH+; R = H or lower alkyl) is 100-200mM; 2. "hot start" (temp. range 50-95 of edgree C) may be used; and 3. one of the downstream probes has a mismatch within 5 bases from the 5' end so it is not complementary to the target sequence (The complementary probe is also mismatched). These may be used either on their own or in conjunction.

These may be used either on their own or in conjunction.

Add62245 and AAQ62246 are used to detect the G551D mutation in cystic fibrosis. The remaining probes are selected from AAQ62247-50. This invention is also applicable to other disease related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

This sequence represents the 5' end of Alfalfa Mosaic virus 4 RNA. This sequence was used in the method of the invention for detecting the enzyme activity in a sample. The method comprises: (a) adding an oligonucleotide substrate to a sample to generate an oligonucleotide product; (b) hybridising the oligonucleotide prod. with a DNA remplate which comprises a first segment complementary to the oligonucleotide and a 5' extension of at least one nucleotide attached to the 5' end of the DNA segment, such that a DNA:RNA hybrid or a DNA:DNA duplex is formed; (c) adding a DNA polymerase and labelled mononucleotides such the box.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      that the DNA polymerase incorporates the monouncleotides to the 3 end of the oligomucleotide, and (d) measuring the amt. of labelled hybrid prod. as a measure of the amt. of the enzyme activity in the sample. The method is used to assay for enzymes e.g. endonuclease, exonuclease or ribozymes, that act on substrates to generate single stranded oligomucleotide prods. by cleaving the substrate which then forms a primer for extension by a DNA polymerase on a template. It can be used to identify the position where the enzyme cleaves the substrate. The assay can also be used to screen for inhibitors of these enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                   Detection of enzyme pref. endonuclease or ribozyme, in a sample by cleavage of an RNA substrate to generate a primer for a labelled
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

AMA 7264-T47280 represent capped RNA molecules produced by the method of the invention is for producing capped RNA con congrises reacting a RNA or analogue. The method comprises reacting a RNA or analogue coligonucleotide with a phosphate addition agent to form a RNA or analogue mono-, di- or triphosphate, which is then capped. The presence of the cap is important for mRNA maturation, initiation of translation, and protects the mRNA against various RNases present in the cell. The capped RNA or analogue is an influenza endonuclease aptamer, useful for capped RNA or analogue is an influenza infection in an animal. The synthetic capped RNA are substrates for virally encoded endonuclease associated with influenza virus. The short non-extendible (due to their length or because of the modification of the 3' end of the oligo) RNA molecules are potent inhibitors of the clavage of capped RNA by influenza condonuclease. They may be used to investigate viral and cellular mechanisms of transcription/translation, or mRNA maturation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Capped RNA molecule, mRNA maturation, translation initiation, influenza, endonuclease aptamer; RNase; therapy; inhibitor; 88.
                                                                                                                                                                                                                  Production of capped RNA or analogues - useful as substrates for
influenza virus associated virally encoded endonuclease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                             This sequence represents the 5' end of Alfalfa Mosaic virus 4 RWA.

This sequence was used as a substrate for influenza endomuclease in the method of the invention. The method allows detection of influenza endomuclease activity in a sample and comprises: (a) adding an influenza endomuclease substrate to a sample and comprises: (a) adding an influenza endomuclease substrate to a sample to generate an RNA product; (b) hybridising the RNA prod. with a DNA template which comprises a first segment complementary to the RNA and a 5' extension of at least one nucleotide attached to the FNA and a 5' extension of at least one nucleotide attached to the 5' end of the DNA segment, such that a DNA:RNA hybrid is formed; (c) adding a DNA polymerase and labelled monourlectides such that the DNA polymerase incorporates the monourlectides to the 3' end of the RNA in the RNA:DNA duplex; and (d) measuring the amount of labelled hybrid prod. as a measure of the monour of influenza endomuclease activity. The method is used to quantitate which then forms a primer for extension by a DNA polymerase on a template. The assay does not influenza endomuclease by cleaving the RNA substrate which then forms a primer for extension by a DNA polymerase the amount of influenza endomuclease by cleaving the RNA substrate which then forms a primer for extension by a DNA polymerase the amount of substrate the amount of influenza endomuclease by cleaving the SNA substrate which then forms a primer for extension by a DNA polymerase the thus may be run in a 96-well microtitre plate. The assay also monitors substrate cleavage at the correct position thereby discriminating against non-specific cleavage products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ኔ
                                                                                                                                                                                                                                                                                                                                                                                                                    AAT47264-T47280 represent capped RNA molecules produced by the method of the invention. The method of the invention is for producing capped RNA or RNA analogues. The method comprises reacting a RNA or analogue oligonucleotide with a phosphate addition agent to form a RNA or analogue mono., di- or triphosphate, which is then capped. The presence of the cap is important for mRNA maturation, initiation of translation, and protects the mRNA against various RNases present in the cell. The capped RNA or analogue is an influenza endonuclease aptamer, useful for treating or preventing an influenza endonuclease aptamer, useful for capped RNA are substrates for virally encoded endonuclease associated with influenza virus. The short non-extendible (due to their length or because of the modification of the 3' end of the oligo) RNA molecules are content inhibitors of the cleavage of capped RNA by influenza endonuclease. They may be used to investigate viral and cellular endonuclease. They may be used to investigate viral and cellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

AAT47264-T47280 represent capped RNA molecules produced by the method of the invention is for producing capped RNA or nalogues. The method comprises reacting a RNA or analogue.

Or RNA analogues. The method comprises reacting a RNA or analogue.

Cligomuclectide with a phosphate addition agent to form a RNA or analogue mono., di- or triphosphate, which is then capped. The presence of the cap is important for mRNA maturation, initiation of translation, and protects the mRNA against various RNAses present in the cell. The capped RNA or analogue is an influenza endonuclease aptamer, useful for treating or preventing an influenza endonuclease aptamer, useful for capped RNA are substrates for virally encoded endonuclease associated with influenza virus. The short non-extendible (due to their length or because of the modification of the 3' end of the oligo) RNA molecules are content inhibitors of the cleavage of capped RNA by influenza concurred the short mouse of the oligo) RNA molecules are endonuclease. They may be used to investigate viral and cellular mechanisms of transcription/translation, or mRNA maturation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Capped RNA molecule, mRNA maturation, translation initiation, influenza, endonuclease aptamer, RNase, therapy, inhibitor, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                   Production of capped RWA or analogues - useful as substrates for influenza virus associated virally encoded endonuclease

ART47264-T47280 represent capped RNA molecules produced by the method of the invention is for producing capped RNA correction. The method of the invention is for producing capped RNA analogues. The method comprises reacting a RNA or analogue.

Or RNA analogues. The method comprises reacting a RNA or analogue collisions analogue mono, di- or triphosphate, which is then capped. The presence of the cap is important for mRNA maturation, initiation of translation, and protects the mRNA against Various RNases present in the cell. The capped RNA or analogue is an influenza endonuclease aptemer, useful for treating or preventing an influenza infection in an animal. The synthetic capped RNA are substrates for virally encoded endonuclease associated with influenza virus. The short non-extendible (due to their length or pecause of the modification of the 3' end of the oligo) RNA molecules are potent inhibitors of the cleavage of capped RNA by influenza may be used to investigate viral and cellular mechanisms of transcription/translation or mechanisms of transcription or mechanisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Capped RNA molecule; mRNA maturation; translation initiation; influenza; endonuclease aptamer; RNase; therapy; inhibitor; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Production of capped RNA or analogues - useful as substrates for influenza virus associated virally encoded endonuclease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   endonuclease. They may be used to investigate viral and cell mechanisms of transcription/translation, or mRNA maturation.

the invention. The method of the invention is for producing capped RNA the invention. The method of the invention is for producing capped RNA or RNA analogues. The method comprises reacting a RNA or analogue coligonucleotide with a phosphate addition agent to form a RNA or analogue mono, di- or triphosphate, which is then capped. The presence of the cap is important for mRNA maturation, initiation of translation, and protects the mRNA against various RNases present in the cell. The capped RNA or analogue is an influenza endonuclease aptamer, useful for capped RNA are substrates for varially encoded endonuclease associated with influenza virus. The short non-extendible (due to their length or capped RNA are substrates for virally encoded endonuclease associated with influenza virus. The short non-extendible (due to their length or because of the modification of the 3' end of the oligo) RNA molecules are potent inhibitors of the cleavage of capped RNA by influenza endonuclease. They may be used to investigate viral and cellular endonuclease. They may be used to investigate viral and cellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Capped RNA molecule; mRNA maturation; translation initiation; influenza; endonuclease aptamer; RNase; therapy; inhibitor; ss.

ANT47264-T47280 represent capped RNA molecules produced by the method of the invention is for producing capped RNA correct analogues. The method comprises reacting a RNA or analogue correct analogue method comprises reacting a RNA or analogue coligonucleotide with a phosphate addition agent to form a RNA or analogue mono-, di- or triphosphate, which is then capped. The presence of the cap is important for mRNA maturation, initiation of translation, and protects the mRNA against various RNases present in the cell. The capped RNA or analogue is an influenza endonuclease aptamer, useful for capped RNA are substrates for virally encoded endonuclease associated with influenza virus. The short non-extendible (due to their length or because of the modification of the 3' end of the oligo) RNA molecules are potent inhibitors of the cleavage of capped RNA by influenza condonuclease. They may be used to investigate viral and cellular mechanisms of transcription/translation, or mRNA maturation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Capped RNA molecule; mRNA maturation; translation initiation; influenza; endonuclease aptamer; RNase; therapy; inhibitor; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAT47264-T47280 represent capped RNA molecules produced by the method of the invention is for producing capped RNA cor analogues. The method comprises reacting a RNA or analogue.

Or RNA analogues. The method comprises reacting a RNA or analogue cor in the method comprises reacting a RNA or analogue and in important for mRNA maturation, initiation of translation, of the cap is important for mRNA maturation, initiation of translation, and protects the mRNA against various RNAses present in the cell. The capped RNA or analogue is an influenza endonuclease aptamer, useful for treating or preventing an influenza infection in an animal. The synthetic capped RNA are substrates for virally encoded endonuclease associated with influenza virus. The short non-extendible (due to their length or because of the modification of the 3' end of the oligo) RNA molecules are potent inhibitors of the cleavage of capped RNA by influenza endonuclease. They may be used to investigate viral and cellular endantsms of transcription/translation, or mRNA maturation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

the invention. The method of the invention is for producing capped RNA consists analogues. The method comprises reacting a RNA or analogue RNA consists analogues. The method comprises reacting a RNA or analogue coligonucleotide with a phosphate addition agent to form a RNA or analogue mono, di- or triphosphate, which is then capped. The presence of the cap is important for mRNA maturation, initiation of translation, and protects the mRNA against various RNAsses present in the cell. The capped RNA or analogue is an influenza endonuclease aptamer, useful for capped RNA are substrates for virally encoded endonuclease associated with influenza virus. The short non-extendible (due to their length or because of the modification of the 3' end of the oligo) RNA molecules are potent inhibitors of the cleavage of capped RNA by influenza continuates in the cleavage of capped RNA by influenza continuation. The charage of capped RNA by influenza continuations of the cleavage of capped RNA by influenza continuation translation, or mRNA maturation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Capped RNA molecule; mRNA maturation; translation initiation; influenza; endonuclease aptamer; RNase; therapy; inhibitor; 88.

AAT47264-T47280 represent capped RNA molecules produced by the method of the invention is for producing capped RNA control or RNA analogues. The method comprises reacting a RNA or analogue cor RNA analogues. The method comprises reacting a RNA or analogue coligonucleotide with a phosphate addition agent to form a RNA or analogue mono. di- or triphosphate, which is then capped. The presence of the cap is important for mRNA maturation, initiation of translation, and protects the DRNA against various RNases present in the cell. The capped RNA or analogue is an influenza endomuclease aptamer, useful for treating or preventing an influenza endomuclease aptamer, useful for capped RNA are substrates for virally encoded endonuclease associated with influenza virus. The short non-extendible (due to their length or because of the modification of the 3' end of the oligo) RNA molecules are often inhibitors of the cleavage of capped RNA by influenza potent inhibitors of the cleavage of capped RNA by influenza endomuclease. They may be used to investigate viral and cellular endomuclease. They may be used to investigate viral and cellular

                     AAT47264-T47280 represent capped RNA molecules produced by the method of the invention is for producing capped RNA caralogues. The method comprises reacting a RNA or analogue CARA analogues. The method comprises reacting a RNA or analogue CARA analogues. The method comprises reacting a RNA or analogue CARA analogue mono-, di- or triphosphate, which is then capped. The presence of the cap is important for mRNA maturation, initiation of translation, or translation, and protects the mRNA against various RNases present in the cell. The capped RNA or analogue is an influenza endonuclease aptamer, useful for treating or preventing an influenza infection in an animal. The synthetic capped RNA are substrates for virally encoded endonuclease associated with influenza virus. The short non-extendible (due to their length or because of the modification of the 3' end of the oligo) RNA molecules are coptent inhibitors of the clavage of capped RNA by influenza condonuclease. They may be used to investigate viral and cellular endonuclease. They may be used to investigate viral and cellular methods are condonuclease. They may be used to investigate viral and cellular captangents.

AAT47264-T47280 represent capped RNA molecules produced by the method of the invention is for producing capped RNA or Rablogues. The method comprises reacting a RNA or analogue and or the method comprises reacting a RNA or analogue. The method comprises reacting a RNA or analogue coligonucleotide with a phosphate addition agent to form a RNA or analogue mono-, di- or triphosphate, which is then capped. The presence of the cap is important for mRNA maturation, initiation of translation, and protects the mRNA against various RNases present in the cell. The capped RNA or analogue is an influenza enfoncelease aptemer, useful for treating or preventing an influenza infection in an animal. The synthetic capped RNA are substrates for virally encoded endonuclease associated with influenza virus. The short non-extendible (due to their length or because of the modification of the 3' end of the oligo) RNA molecules are potent inhibitors of the cleavage of capped RNA by influenza endonuclease. They may be used to investigate viral and cellular endonuclease. They may be used to investigate viral and cellular endonuclease of transcription/translation, or mRNA maturation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Preparation of antiBense oligo:nucleotide(8) which lack long runs of consecutive guanosine or inosine - and have specific ratio of residues able to form two or three hydrogen bonds, have greater activity, and reduced toxicity, used therapeutically or to modulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          \lambda\lambda V49008-236 represent antisense oligonucleotides directed against the rb gene. cc effective downregulation of negative growth control by rb, while oligonuclectides AN49052-236 had little effect. The oligonuclectides conjugurations the specification describes oligonuclectides conformation. The specification describes oligonuclectides that contrain 8-30 nuclectides, which contain at most 8 nuclectides and conscious consecutive nuclectides able to form three H-bonds each to four consecutive ordesines; do not contain two sequences of three consecutive consecutive consecutive consecutive consecutive consecutive consecutive consecutive consecutive bonds (3R) is given by 2R/3R = 0.33-0.72. The nucleotides acts able to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The consecutive conformation of primary cell cultures (e.g. bone marrow seem, liver or proliferation of primary cell cultures (e.g. bone marrow seem, liver or kidney cells, osteoblasts and/or keratinocytes). The coligonuclectides can also be used to analyse function of proteins (by altering their expression or activity) and therapeutically, e.g. in cases of cancer or (targeting TGF) for stimulating the immune system.

Novel biallelic markers used to construct a high density disequilibrium

Chumakov

Cohen D, Blumenfeld M,

WPI; 2000-013267/01.

Claim 8; Page 2110; 2745pp; English.

map of the human genome

AA265654 to AA269578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nuclectie sequences. AA269579 to AA27740 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haploryping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and disgnostic methods, as well as the characterisation of the differential efficacious responses to and side

effects from pharmaceutical agents acting on a disease as well as other

rreatment. N.B. The SEQ 1D NOB 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297

Human prostate cancer marker - useful for detection and treatment of human prostate cancer

Example 4; Page 120; 229pp; English.

This primer is used in the relative quantitative RT-PCR to examine the expression of the genes which is used for the identification of markers of human prostate cancer. Isolated nucleic acid segments shown in AAV16881 to AAV16882, AAV16890 to AAV16903, AAV26351 and AAV26352 which can act as human prostate cancer markers are provided in the specification. The specification also provides methods for identifying markers for human prostate cancer and for detection of prostate cancer earls. The markers can be identified by amplifying human prostate RNA to provide nucleic acid amplification products, separating the products and identifying those RNA that are differentially expressed between human

```
ö
prostate cancers versus normal or benign human prostate. Prostate cancer cells in a sample can be detected by detecting a nucleic acid in a sample, the nucleic acid being a prostate cancer marker. Primers and probes derived from this marker can be used for the detection of prostate cancer cells in a sample. Antibodies against the protein encoded by the marker nucleic acid fragments, inhibitors of the protein and oligomucleotides autisense to the markers can be used in the treatment of prostate cancer. The antibodies can also be used for the diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                 Human biallelic marker downstream amplification primer SEQ ID NO:8817.

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MNP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule [11] comprising a promoter operably linked to a nucleic acid segment encoding [1]. [1] can have antipsoriatic, ophthalmological, cytostatic, antiseborrheic, antidiabetic, antisickling, cphthalmological, cytokine involved in inflammation. [1] can be used in gene therapy. [1] and [11] are useful for treating proliferative skin diseases such as psoriadis, atopic dermatitis, actinic keratosis, skin diseases such as psoriadis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diseases. Computating retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn and an analyse of the scarring such as keloid, adhesion and hypertrophic or hypertrophic burn and an analyse of the scarring such as keloid, adhesion and hypertrophic or hypertrophic burn and an analyse of the scarring such as keloid, adhesion and bypertrophic or hypertrophic burn and some

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in AAAS2415 to AAA86787. The ribozyme of the invention is useful for inhibiting restences by introduction of the ribozyme is resistant to and anomuclease activity and hence is efficient in restences treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1 -

monitoring (the rate of) progression of a disease, e.g. atherosclerosis or congestive heart failure, comprises diagnostic oligonucleotides New system for leukocyte expression profiling, diagnosing a disease, monitoring (the rate of) progression of a disease, e.g. atherosclero

Claim 1; Page 382; 2038pp; English.

The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ008152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis or cytomegalovirus infection.

Human GPR31 gene polymorphism detecting ASO primer #1. (first entry) 26-MAR-2002

Human; G-protein coupled receptor 31; GPR31 protein; haplotyping;

The invention relates to genetic variants of human G-protein coupled receptor 31 (GPR31) gene. The invention also relates to compositions and methods for haplotyping and/or genotyping the GPR31 gene in an individual. Polymuclectides of the invention are useful in studying the expression and function of GPR31, and in expressing GPR31 protein for use in screening candidate drugs to treat diseases related to GPR31 activity and in studying the effect of the variation on the biological activity of GPR31 as well as on the binding affinity of candidate drugs targetting GPR31 for the treatment of cancer. They are also used in gene therapy. The haplotyping method is useful for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with GPR31 activity. e.g. cancer. This method is also useful for haplotyping GPR31 activity e.g. cancer. This method is also useful for the pharmaceutical research scientist to validate GPR31 as a candidate carget for, and in design of clinical trials of candidate drugs, for treating a specific condition drugs or disease predicted to be associated with GPR31 activity. The present sequence is an allele specific objective objective objective objective (ASO) primer used to detect human GPR31 Novel genetic variants of G-protein coupled receptor gene useful imstudying expression and function of the protein, and for screening drugs to treat diseases e.g. cancer genotyping; gene therapy; cancer; polymorphism; ASO; primer; allele-specific oligonucleotide; ss. The invention relates to a novel method for synthesising a target base sequence-containing nucleic acids. The method comprises the formation of single-stranded nucleic acids; synthesis of complementary strand by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Synthesizing target base sequence-containing nucleic acids constituting complementary base sequences against template by the LAMP method, applicable in identifying genetic diseases, cancerization and microrganisms -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Synthesising, target base sequence, annealing, genetic disease, SNP, single nucleotide polymorphism, cancer; PCR; primer; ss.
                                                                                                                                                                  This sequence is an example of a 2-5A-antisense oligonucleotide chimeric molecule. The antisense region targets the chimeric molecule to a particular region of RNA to be specifically cleaved and the 2',5'-linked tetraadenylate tail activates the 2-5A RNAse. Typical applications are treatment of viral infections (esp. for cleaved of a RNA virus genome), cancer; leukaemia, cardiovaecular disorders (e.g. restenosis after angioplasty), genetic disorders, osteoarthritis or rheumatoid
                                                                      Specific cleavage of RNA, useful partic. for treating viral infection, cancers, etc. - by using anti-sense oligo:nucleotide coupled to activator of 2-5A dependent RNase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid synthesising method related PCR primer, SEQ ID No

                                                                                                                                                                                                                                                                          The invention relates to performing a thermal cycle of PCR by using a substrate on which a deoxyribonucleic acid (DNA) is immobilized. The method is useful in the medical, biochemical, molecular biological and genetic engineering fields. Sequences ABQ79871-881 represent PCR primers used in the method of the invention.

    Ò
annealing; and producing single-etranded nucleic acid from a target base sequence by the synthesis of a complementary strand by annealing of a complementary base sequence. The method is useful for synthesising a target base sequence-containing nucleic acids, which is applicable in detecting SNP (single nucleotide polymorphism) in genes, identifying genetic diseases, cancer and microorganisms. Such a method can be easily, rapidly and freely carried out without being influenced by contamination or complicated temperature control, but with improved reaction specificity, high accuracy and efficiency, operable at low cost. This polynucleotide sequence represents a PCR primer used in the synthesising method of the invention.
                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                Mouse TNF-a hammerhead ribozyme target sequence (nt position 1326).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mouse TNF-a hammerhead ribozyme target sequence (nt position 1311).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves TNR-alpha mRNA at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed any synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit TNR-alpha expression, making them potentially useful for treating rheumatoid arthritis, septic shock and other inflammatory disorders including psoriasis, as well as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Enzymatic nucleic acid; ribozyme; trans cleavage; inhibition; gene expression; downregulation; interleukin-5; IL-5; ICAM-1; intercellular adhesion molecule; rel A; tumour necrosis factor; TWF-alpha; respiratory syncytial virus; RSV; bor-abl; oncogene; translocation; chromic myelogenous leukaemia; OHL; cancer; Philadelphia chromosome; inflammation; autoimmune disease; atheroselerosis; myocardial infarction; stroke; restenosis; transplant rejection; rheumatoid arthritis; psoriaais; myocardial ischaemia; Rawasaki disease; septic shock; HIV; human immunodeficiency virus; acquired immune deficiency syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ..

Ribozymes having modified bases and methods for producing them for use in inhibiting disease related genes

Claim 2; Page 252; 407pp; English.

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves TWR-alpha mRNA at the nucleotide base position indicated in the DE line. Segions of the mRNA that do not form secondary folding structures and that contain potential harmerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed any synthesised with modifications that improve their nuclease sequences and thereby inhibit TWF-alpha expression, making them potentially useful for treating rheumatoid architis, septic shock and other inflammatory disorders including psoriasis, as well as for treatment of AIDS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mouse TNF-a hammerhead ribozyme target sequence (nt position 1314).
enzymatic nucleic acid (i.e. a ribozyme) which cleaves TNF-alpha manNa at the nucleotide base position indicated in the DE line. Regions of the mENA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit TNF-alpha expression, making them potentially useful for treating rheumatoid archritis, septic shock and other inflammatory disorders including psoriasis, as well as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Enzymatic nucleic acid; ribozyme; trans cleavage; inhibition; gene expression; downregulation; interleukin-5; IL-5; ICAM-1; intercellular adhesion molecule; rel A; turmour necrosis factor; TNF-alpha; respiratory syncytial virus; RSV; borr-abl; oncogene; translocation; chromic myelogenous leukaemia; CML; cancer; Philadelphia chromosome; inflammation; autoimmune disease; atherosclerosis; myocardial infarction; stroke; restenosis; transplant rejection; rheumatoid arthritis; psoriasis; myocardial ischaemia; Kawasaki disease; septic shock; HIV; human immunodeficiency virus; acquired immune deficiency syndrome;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves TNF-alpha mRNA at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against them sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit TNF-alpha expression, making them potentially useful for treating rheumatoid arthritis, septic shock and other inflammatory disorders including psoriasis, as well as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Enzymatic nucleic acid; ribozyme; trans cleavage; inhibition; gene expression; downregulation; interleukin-5; IL-5; ICAM-1; intercellular adhesion molecule; rel A; tumour necrosis factor; TNF-alpha; respiratory syncytial virus; RSV; bcr-abl; oncogene; translocation; chromic myelogenous leukaemia; CML; cancer; Philadelphia chromosome; inflammation; autoimmune disease; atherosclerosis; myocardial infarction; stroke; restenosis; transplant rejection; Theumatoid arthritis; psoriaals; myocardial ischaemia; Kawasaki disease; septic shock; HIV; human immunodeficiency virus; acquired immune deficiency syndrome;
